

BLAST-INDUCED VIBRATION DATA EVALUATION PROGRAM

Created By:
U.S. Department of Interior
Office of Surface Mining Reclamation and Enforcement (OSMRE)
Appalachian Region
Technical Support Division
Three Parkway Center
Pittsburgh, Pennsylvania 15220

Overview

The Blast-Induced Vibration Data Evaluation Program (BIVDEP) statistically evaluates ground vibration and air overpressure (i.e. airblast) data collected from a series of monitored blast events at a surface mine. The statistical evaluation allows the user to approximate peak particle velocity (PPV) and peak airblast (AB) for future blast events using square root and cube root scaling techniques respectively. The evaluation results can also be used to develop a modified scaled-distance factor at a surface mine or within a region. The BIVDEP is a comprehensive update to a previously released blasting tool called "OSMRE Regression Analysis for Ground Vibrations and Airblast".

The BIVDEP evaluates blast event monitoring data with many different corresponding charge-weights per delay (CW) by normalizing the distance from the blast (D). In other words, distance and charge-weight per delay are combined to form a single number, which can then be plotted or used in calculations. The most common way of combining distance and charge-weight per delay is to divide the distance by the square root (for ground vibration) or the cube root (for airblast) of the maximum charge-weight per delay. The resulting number is referred to as the square root scaled distance (SD_2) and the cube root scaled distance (SD_3).

The BIVDEP works as an easy to use Microsoft Excel spreadsheet. The only data necessary to perform an evaluation is the D, CW, PPV, and AB for a monitored blast event. As the user enters the required input data for each monitored blast event, the BIVDEP plots the PPV and AB against the corresponding SD_2 and SD_3 on a log-log graph, respectively. The BIVDEP generates a best-fit line for both graphs using a least squares regression analysis, which will allow the user to approximate the PPV and AB for future blast events. An upper bound line is also generated for both graphs using a confidence interval of at least ninety-five (95) percent. Up to two-hundred and twenty (220) monitored blast events (i.e. a data set) can be evaluated.

The methods and techniques used in the BIVDEP are based largely on the discussion presented in the *International Society of Explosives Engineers (ISEE), Blaster's Handbook, 18th Edition, Chapter 26 - Vibration, Pages 551 through 630*. This reference is a valuable resource in understanding how the BIVDEP reduces, evaluates, and presents the blast-induced monitoring data. BIVDEP users are encouraged to review the discussion in Chapter 26 prior to using the BIVDEP.

BIVDEP Instructions

1. The BIVDEP and supporting document can be downloaded from the OSMRE Appalachian Region blasting website (ARblast: <http://www.osmre.gov/resources/blasting/arblast.shtm>). Go to the ARblast website and scroll down to the resource table called “Excel Tools”. Click the link for the BIVDEP to download. BIVDEP users are encouraged to check the ARblast website periodically for any updated versions of the BIVDEP.
2. The user should read the supporting instructions and review the example provided in Attachment A prior to using the BIVDEP. Refer to the table in the following section for guidance on the required input data fields.
3. Open the BIVDEP spreadsheet and immediately save the file as a different name. Start by clicking on the File tab in the upper left, select the save-as option, and then enter the new file name. The file should be named in reference to the mine site or permit number.
4. Select the “Input_Data” worksheet tab at the lower left of the spreadsheet to begin using the BIVDEP. Be aware, an artificial data set (i.e. 184 monitored blast events) has been entered for illustration and example purposes only.
5. Blue font in the “Input_Data” worksheet identifies required data entry by the user. Black font identifies the BIVDEP template text and should not be edited. Refer to the table in the following section for guidance on the required input data fields.
6. The red font in the “Input_Data” worksheet identifies data cells that contain a calculation or rule and therefore, cannot be edited. The red font data cells are password protected from all editing.
7. The artificial data is only intended as an example of data entry. **The user must delete all of the artificial data prior to using the BIVDEP.** Simply highlight the artificial example data (i.e. the blue font) and delete.
8. Select the “Input_Data” worksheet tab at the lower left of the spreadsheet and enter the following in rows 1 and 2 of Page 1: Review Agency, Blaster, Surface Mine, Permit No., Review Date, and Reviewed by. The user only needs to enter this information once. This information is very useful and will print automatically on each graph and input data summary sheets.
9. The user may enter the date and the seismograph unit location for each monitored blast events. These data fields are optional but, are recommended for consistency and completeness.

10. Enter the D and CW for each blast-induced vibration event. The square root and cube root scaled distances will calculate automatically.
11. Continue entering the corresponding PPV and AB for the blast-induced vibration event. The statistical evaluation is performed and the graphs are generated automatically.
12. **Caution:** The user must adhere to the following instruction in order for the BIVDEP to function correctly. Because of the statistical tools used in the BIVDEP, there can be no gaps in the data field entry and the data rows must be consecutive. The user must not skip or delete data rows or cells. In other words and for example, if the user has 184 blast records to be entered, the user must input 184 D's, CW's, PPV's, and AB's each in 184 data rows consecutively. This is a requirement for the spreadsheet to function correctly. Failure to do so will result in errors and invalid results. Refer to the example provided in Attachment A for an illustration of proper data entry.
13. **Important Guidance:** For blast logs or seismograph records indicating the unit did not trigger to record the PPV and or the AB, the user may choose to eliminate the blast record from the BIVDEP data set or may choose to enter the trigger threshold settings for the unit (e.g. PPV = 0.05 inch/sec, AB = 120 db). To avoid biasing the BIVDEP results, the data set should not contain a large percentage of records (less than 5%) where the unit did not trigger. Refer to the *ISEE Field Practice Guidelines for Blasting Seismographs, 2015* for guidance on blasting seismograph threshold settings.
14. The user must exercise close attention to detail when entering the required input data. If data entry errors are made, the BIVDEP will alert the user with errors shown in the calculation data cells (e.g. #N/A, #VALUE!, etc.).
15. Upon completing the required input data entry, the user may assess the evaluation results by selecting the "Ground_Vibration" and "Airblast" worksheet tabs to view each graph. It is recommended the user refer to the *ISEE, Blaster's Handbook, 18th Edition, Chapter 26 - Vibration, Pages 551 through 630*. This reference provides an in-depth background on performing statistical analysis of vibration data as well as guidance on how to interpret the BIVDEP evaluation results.
16. **Caution:** The "Ground_Vibration" and "Airblast" worksheet tabs (i.e. the graphs) are not protected and may be edited by the user. This allows the user to edit the graphs to suit their specific needs. However, critical calculations related to the Best Fit Line (i.e. A and B) and the Upper Bound Line (95% Confidence) are performed on the worksheet. The user must not edit these data cells/calculations under any circumstances.

17. **Important Guidance:** It is recommended the user enter a minimum of thirty (30) monitored blast events to ensure the evaluation are statistically valid. Generally, a large data set will provide more reliable approximations. The user is encouraged to evaluate as much reliable data that is available.
18. **Important Guidance:** To ensure reliable PPV and AB approximations, the coefficient of determination or correlation coefficient (R^2) for the blast-induced data set should be no less than 0.70. A good statistical relationship exists if the R^2 is greater than 0.70. However, this does not suggest the data set is not valid if the R^2 is less than 0.70. The lower the R^2 , the greater the amount of data scatter.
19. **Important Guidance:** The user may need to edit or adjust the graph axis scales and plot objects (e.g. legend, R^2 value, titles, etc.) to suit their data set. Simply right-click on either the x or y axes and select "Format Axis" to change the axis scale bounds (i.e. "Axis Options"). Note, because the x and y axes are logarithmic scales, the axis bounds must start and end with a power of ten (i.e. 10, 100, 1000, etc.). Once the axes are established, the user may click on the plot objects and drag them to an appropriate location as necessary.
20. The user must enter the required data input in imperial units (e.g. feet, pounds, inch/second, decibels). However, the results of the BIVDEP evaluation are provided in both imperial and metric units. The user may select either unit based on their needs. Just select the appropriate Ground Vibration and Airblast worksheet tabs.
21. Printing of the BIVDEP evaluation results can be done in whole or individually. Refer to Attachment D for a BIVDEP printed workbook example. In the print window, select either in the settings dropdown menu:
 - a. Entire workbook to print all the tables and graphs accordingly or;
 - b. Active sheet to print the sheet being viewed.

Required BIVDEP Input Data Summary

The BIVDEP requires the following data fields to be entered in the specified format and units. The numeric data fields are formatted in BIVDEP to show the appropriate decimal places. Guidance on data input is provided in the data field description below. Only the D, CW, PPV, and AB data fields are required for the BIVDEP to function properly. The remaining data fields are optional but, are highly recommended for completeness and consistency.

Data Field	Units	Description
Review Agency	Name or ID	Name of the agency or firm conducting the blast log evaluation.
Review Date	MM/DD/YY	Date of the blast log evaluation.
Reviewed By	Name	Name of the individual(s) conducting the evaluation.
Surface Mine	Name	Name of the surface mine related to the permit number.
Permit Number	Number	Permit number assigned by regulatory authority to the surface mine.
Blaster	Name	Blasting company as reported on the blast log.
Blast Date	MM/DD/YY	Date of the blast as reported on the blast log.
Distance From Blast	Feet	Provide the distance to the nearest protected structure as reported on the blast log.
Charge Weight Per Delay (CW)	Number	The charge weight is the maximum weight of explosives detonated within an 8-millisecond delay period.
Peak Particle Velocity (PPV) Reported	Inch per Second (in/sec)	<p>The PPV is the absolute highest zero to peak value measured from a seismograph time-history waveform. Provide the maximum PPV as reported from the blasting seismograph record.</p> <p>If monitoring was conducted but, the unit did not trigger, the user may choose to eliminate the blast record from the BIVDEP data set or may choose to enter the trigger threshold settings for the unit (e.g. PPV = 0.05 inch/second. To avoid biasing the BIVDEP results, the data set should not contain a large percentage of records where the unit did not trigger (less than 5%). Refer to the ISEE Field Practice Guidelines for Blasting Seismographs, 2015 for guidance on blasting seismograph threshold settings.</p>

Data Field	Units	Description
Airblast (AB) Reported	Decibels (dB)	<p>Seismic monitoring of a blast event typically includes a measurement of air vibrations (i.e. air overpressure). Air overpressure or AB is the additional pressure generated from a blast above the normal atmospheric pressure. AB is measured as a pressure and reported in units of decibels. Provide the airblast as reported from the blasting seismograph record.</p> <p>If monitoring was conducted but, the unit did not trigger, the user may choose to eliminate the blast record from the BIVDEP data set or may choose to enter the trigger threshold settings for the unit (e.g. AB = 120 db). To avoid biasing the BIVDEP results, the data set should not contain a large percentage of records where the unit did not trigger (less than 5%). Refer to the ISEE Field Practice Guidelines for Blasting Seismographs, 2015 for guidance on blasting seismograph threshold settings.</p>
Square Root Scaled Distance (SD ₂)	Feet per Square Root of Charge-Weight (ft/lbs ^(1/2))	<p>SD₂ is defined as the distance from the blast site to the seismograph location (D), divided by the square root of the maximum weight of explosives detonated within an 8-millisecond delay period (CW). The equation for square root scaled distance is commonly represented several ways.</p> $SD_2 = D / \sqrt{CW}$ $SD_2 = D / CW^{0.5}$ $SD_2 = D / CW^{(1/2)}$ <p>Where the following units apply: SD₂ is in feet per the square root of pounds (ft/lb^{1/2}); D is in feet (ft); and CW is in square root of charge-weight (lb^{1/2}).</p> <p>Note: An SD₂ value of fifty-five (55 ft/lb^{1/2}) for distances between 301 to 1,000 feet provides a high level of confidence that damage to structures will not occur.</p>

Data Field	Units	Description
Cube Root Scaled Distance (SD ₃)	Feet per Cube Root of Charge-Weight (ft/lbs ^(1/3))	<p>SD₃ is defined as the distance from the blast site to the seismograph location (D), divided by the cube root of the maximum weight of explosives detonated within an 8-millisecond delay period (CW). The equation for cube root scaled distance is commonly represented several ways.</p> $SD_3 = D / \sqrt[3]{CW}$ $SD_3 = D / CW^{0.33}$ $SD_3 = D / CW^{(1/3)}$ <p>Where the following units apply: SD₃ is in feet per the cube root of pounds (ft/lb^{1/3}); D is in feet (ft); and CW is in cube root of pounds (lb^{1/3}).</p>

Technical Issues and Troubleshooting

Contact the individuals listed below for technical assistance. If the spreadsheet doesn't appear to be functioning properly, the spreadsheet may have been unintentionally edited or changed. In this case, simply go to the ARblast website and download a new BIVDEP spreadsheet template. Also, BIVDEP users may send any recommendations for improvement to the individuals listed below.

OSMRE Blast-Induced Vibration Data Evaluation

Mine: Pittsburgh Mine
 Permit: D-12345
 Blaster: Top Flight Blasting

Review Agency: OSMRE
 Review Date: 01/01/19
 Performed By: Brian Farmer, P.E.

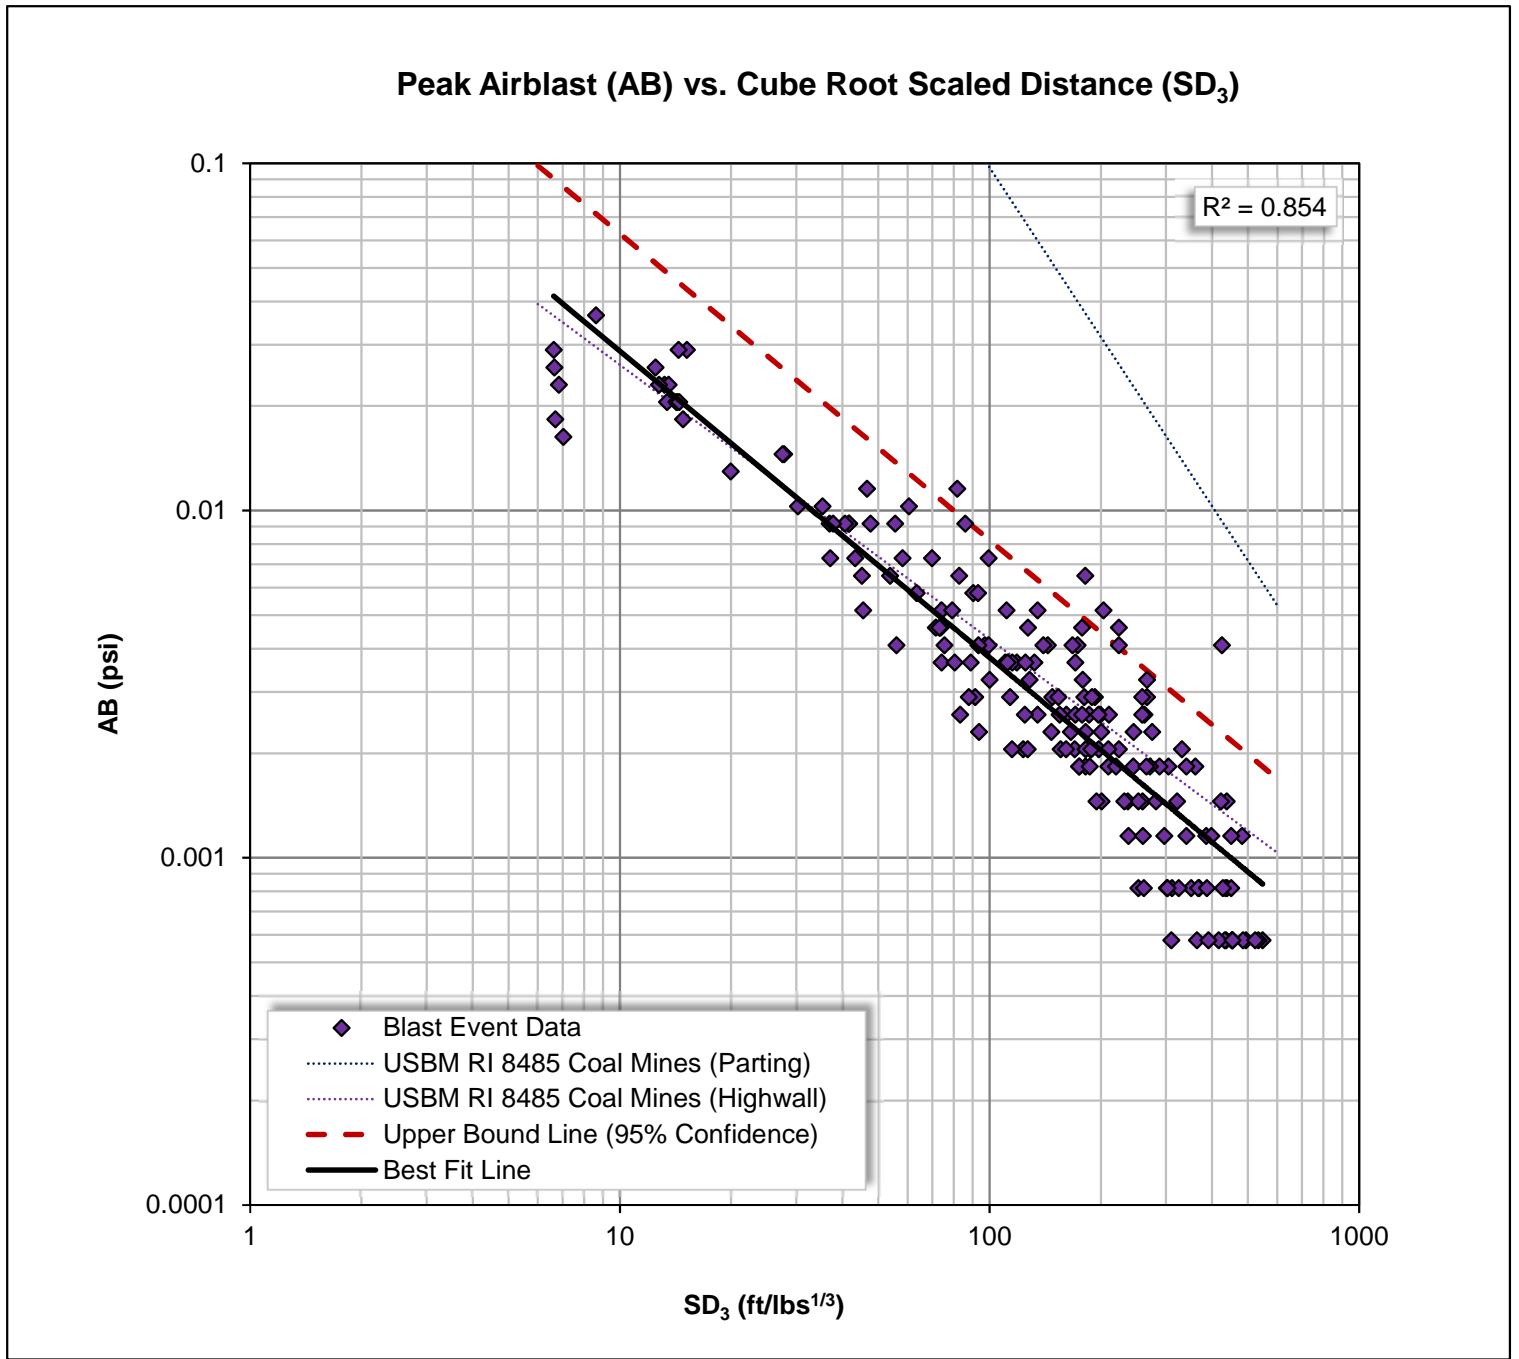

The blast event data was collected intermittently between the following dates: 07/27/00 and 08/29/01.

The Best Fit Line and Upper Bound Line (95% Confidence) may be approximated using the following equation:	
PPV = A x SD₂^{-B}	where A = 37.18 , y-intercept for Best Fit Line at SD ₂ = 1.0
	or A = 112.57 , y-intercept for Upper Bound Line (95% Confidence) at SD ₂ = 1.0
	and B = -1.16 , slope of the Best Fit Line and Upper Bound Line

OSMRE Blast-Induced Vibration Data Evaluation

Mine: Pittsburgh Mine
 Permit: D-12345
 Blaster: Top Flight Blasting

Review Agency: OSMRE
 Review Date: 01/01/19
 Performed By: Brian Farmer, P.E.

The blast event data was collected intermittently between the following dates: 07/27/00 and 08/29/01.

The Best Fit Line and Upper Bound Line (95% Confidence) may be approximated using the following equation:	
$AB = A \times SD_3^{-B}$	where A = 0.220 , y-intercept for Best Fit Line at $SD_3 = 1.0$
	or A = 0.479 , y-intercept for Upper Bound Line (95% Confidence) at $SD_3 = 1.0$
	and B = -0.883 , slope of the Best Fit Line and Upper Bound Line

OSMRE Blast-Induced Vibration Data Evaluation

Mine: Pittsburgh Mine
 Permit: D-12345
 Blaster: Top Flight Blasting

Review Agency: OSMRE
 Review Date: 01/01/19
 Performed By: Brian Farmer, P.E.

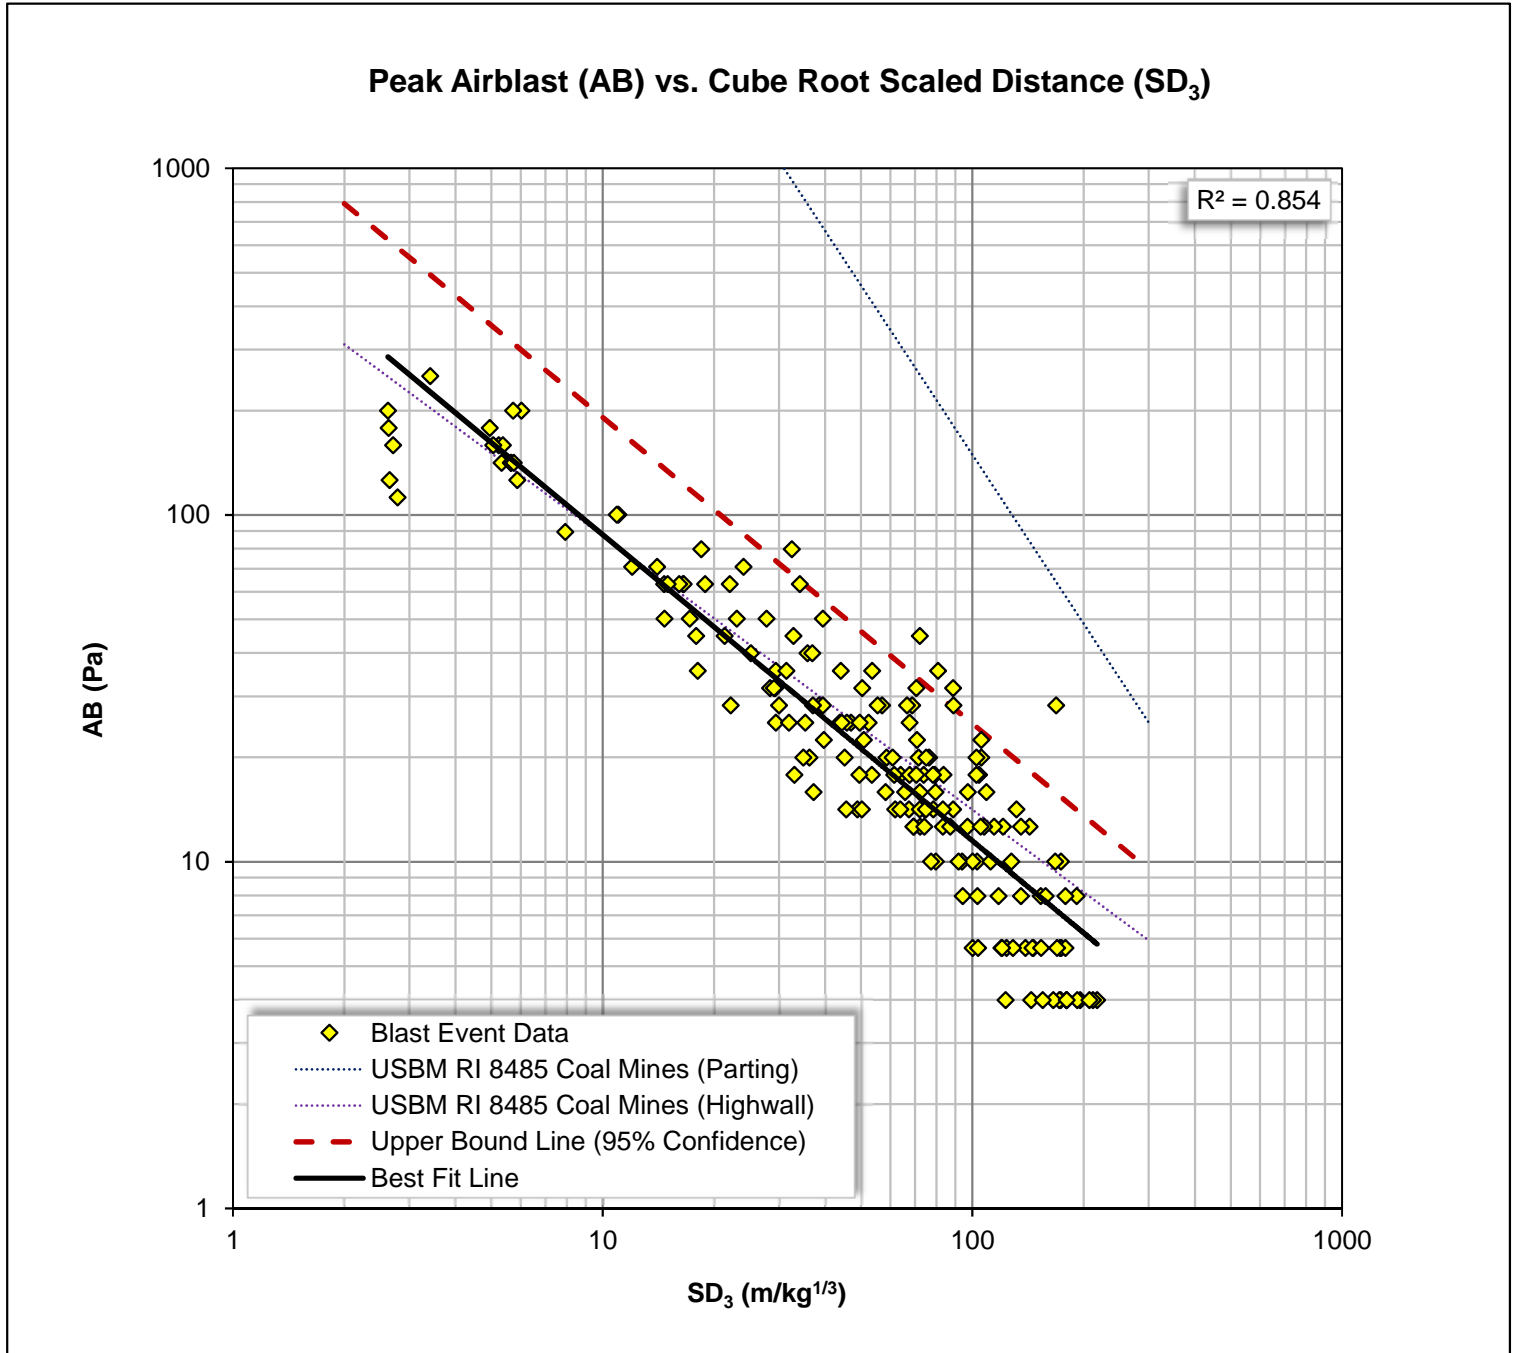

The blast event data was collected intermittently between the following dates: 07/27/00 and 08/29/01.

The Best Fit Line and Upper Bound Line (95% Confidence) may be approximated using the following equation:	
PPV = A x SD₂^{-B}	where A = 376.79 , y-intercept for Best Fit Line at SD ₂ = 1.0
	or A = 1,140.73 , y-intercept for Upper Bound Line (95% Confidence) at SD ₂ = 1.0
	and B = -1.16 , slope of the Best Fit Line and Upper Bound Line

OSMRE Regression Analysis of Airblast Data

Mine: Pittsburgh Mine
 Permit: D-12345
 Blaster: Top Flight Blasting

Review Agency: OSMRE
 Review Date: 01/01/19
 Performed By: Brian Farmer, P.E.

The blast event data was collected intermittently between the following dates: 07/27/00 and 08/29/01.

The Best Fit Line and Upper Bound Line (95% Confidence) may be approximated using the following equation:	
AB = A x SD₃^{-B}	where A = 669.73 , y-intercept for Best Fit Line at SD ₃ = 1.0
	or A = 1,458.97 , y-intercept for Upper Bound Line (95% Confidence) at SD ₃ = 1.0
	and B = -0.88 , slope of the Best Fit Line and Upper Bound Line
