REV. NUMBER	REVISION DESCRIPTION	DATE APPROVED

SECTION 50 BONDING

50.1 Bond Scheme

The determination of the bond is an estimation of the maximum reclamation cost that the Regulatory Authority would incur in the event of bond forfeiture by Navajo Mine. Areas bonded under this permit area include those areas which will be disturbed in the process of recovering coal from the No Name Permit (NNP) permit area and those areas required to construct facilities or infrastructure that support the production activities. The following costs and procedures apply only for determining the bond dollar figure for the maximum reclamation requirement (worst case scenario), and are not necessarily meant to represent current or future operational practices.

50.1.1 Maximum Reclamation Liability during the Permit Term

The bond evaluation prepared for this permit reflect the worst case pit scenario. Given that NTEC will open the initial mining areas in No Name and will progress pit development throughout the permit term while not yet disturbing sufficient acreage to facilitate significant reclamation activities, the cumulative disturbance will reach the maximum late in the permit term. Throughout the five-year term, strip progression results in an increase in disturbed land, increased pit depths, and slight increases in pit lengths.

The amount of mining (stripping) disturbance to occur during the permit term is related to strip progression and timing, which is presented on Exhibit 34.2-1. The bond scenario presented here does not necessarily match the strip progression timing shown in the permit term disturbance exhibits. This is due to the remaining uncertainty regarding actual start dates for the mining (stripping) operations, which are ultimately a function of the timing of the first coal requirements from the customer. In order to address this uncertainty and ensure that NTEC will be sufficiently bonded the worst case scenario, the maximum likely amount of mining (stripping) disturbance has been considered. The regraded area of disturbance (final surface configuration) is also shown on Exhibit 34.1-1.

50.2 Extended-Liability Bond Areas

NTEC does not have any extended liability bond areas associated with NNP; therefore, this section is not applicable.

50.3 Bonding of Facilities Used in Common

Currently, there are no facilities and infrastructure (e.g., powerlines, ancillary roads, etc.) within the permit area that are also considered in NTEC Navajo Mine's bond amount.

50.4 Reclamation Cost Estimate

50.4.1 Reclamation Costs

Reclamation costs are calculated as shown in Appendix 50.A, Worksheets 50.2 through 50.17. The methods and format used in this calculation are consistent with the guidance contained in the OSM *Handbook for Calculation of Reclamation Bond Amounts* (OSM 2020). A summary of the reclamation bond amount is presented in Table 50.4-1.

Reclamation liabilities attributable to NNP permit areas during the permit term will occur in Area 4 South and Area 5. It is assumed that the final bond pit will progress as shown in Exhibit 50.4-1 and will be stripped to their lowest economically recoverable coal seam. Reclamation activities will consist of the following:

1) Facility demolition and removal,
2) Earthmoving – primary and secondary regrade, topdressing, mitigation,
3) Revegetation, and
4) Miscellaneous

50.4.1.1 Facility Demolition and Removal

Facility demolition and removal of all existing permit structures on the mine site includes the industrial complexes; water pipelines, intakes, and loadouts; electric power lines; explosive stores; coal facilities; water control structures; transportation facilities; and miscellaneous structures. A summary of demolition unit costs is presented in Table 50-A-1, Appendix 50.A.

All permit structures are tabulated in Worksheet 50.2 (Appendix 50.A). Structure dimensions and related materials quantities are taken from design drawings and material take-off sheets, while unit costs are from Table 50-A-1, Appendix 50.A. The resulting costs are totaled in Worksheet 50.16, Item 1 (Appendix 50.A).

50.4.1.2 Earthmoving

A post-mining "snapshot" of each area is as shown in the bond post-mining configuration (PMC) map, Exhibit 34.2-1.

The final surface configuration (FSC) selected for the initial permit term is to return the disturbed areas as close as possible to the pre-mining topography. Due to the relatively small area disturbed during the initial term, especially within the mining pits, and due to the fact that most of the mining disturbance occurs on uplands west of Pinabete Arroyo, there is little value in developing a FSC using those methods (Natural Regrade) used to develop the approximate original contour AOC for the entirety of the Area 4 South mining limits.

To achieve FSC (Exhibit 34.1-1), PMC topography in these areas was altered to create reclaimed surfaces falling as close as practical to the pre-mining topography.

The next design step was to subtract a computerized grid of the PMC from the FSC. The result is a cut-fill contours map (Exhibit 50.4-1) with the cut areas shown as red contours, and the fill areas shown as blue contours. The cut and fill areas are then subdivided into polygons and the cut and fills are balanced by taking extra cut to polygons that require fill. The result is the cut-fill blocks map (Exhibit 50.4-1).

The CAD software gives the volume and centroid of each block. The centroids are used to calculate haulage distances and grades, except in the case of deep pits and ramps where haulage is assumed to be to the crest where the material can be pushed over the edge. The haulage profiles and grades are weight averaged by volume to give an average distance and grade for each equipment type.

All bond earthmoving activities are tabulated in Worksheet 3 as follows:

Worksheet 50.5 Dozers
Worksheet 50.8 Loaders
Worksheet 50.9 Trucks
Worksheet 50.11 Scrapers
Worksheet 50.12 Graders
Worksheet 50.15 Drilling and Blasting of Highwalls

Quantities from these worksheets are used as input to Worksheets 50.5 through 50.12, where equipment hours are calculated. Worksheet 50.13 uses these hours to calculate earthmoving costs. The earthmoving costs are totaled in Worksheet 50.16, Item 2. In addition to regrade activities, earthmoving includes spoil mitigation, topdressing placement, and concrete disposal.

Once regrading and/or facilities removal activities have been completed in an area, required suitable root zone mitigation and/or topdressing material is placed on these areas (Exhibit 50.4-2).

Suitable spoil and regolith/topdressing material (either stockpiled or in situ) are used to complete the 4-ft suitable root zone material requirements on spoil surfaces. Stockpiled and/or in-situ regolith/topdressing material is used to complete the topdressing material depth requirement on all reclaimed surfaces. Refer to Section 36 (Post-Reclamation Soil) for additional information regarding root zone material and topdressing replacement requirements.

50.4.1.2.1 Equipment Selection

Large earthmoving equipment was selected assuming that a competent, qualified contractor will be doing the reclamation work using their own equipment.

50.4.1.2.2 Equipment Productivity and Costs

Reclamation activities will take place with a 20-shift-per-week schedule. Equipment ownership and operating costs are tabulated in Table 50-A-23 (Appendix 50.A). Equipment operator wage rates are listed in Table 50-A-24 (Appendix 50.A).

For haul routes greater than 600 ft, scrapers are more economical than dozers. For haul routes greater than 3,000 ft, dump trucks are more economical than scrapers. Dozers are assumed to work alone with no support equipment other than a lowboy for transport. Truck and scraper fleets both require load and dump dozers, and half-time water truck and grader for haul road maintenance. All fleets are assigned light plants for night work. Fuel and lube trucks are included in the fuel costs (Table 50-A-23 in Appendix 50.A).

Productivities for each particular activity are calculated in Worksheets 50.5 through 50.12 (Appendix 50.A), using the material properties and haulage profile pertaining to the task.

50.4.1.3 Revegetation

After regrading, the bonded areas will be graded with graders and then these areas and facilities areas will be topdressed as noted in previously. After topdressing, revegetation activities will commence. This involves seeding, crimping, mulching, and irrigation as described in Section 37 (Post-Reclamation Vegetation). Costs are noted in Appendix 50.A, Worksheet 50.14.

50.4.1.4 Miscellaneous

No miscellaneous costs were required for the initial permit term bond scenario.

50.4.3 Indirect Reclamation Costs

Mobilization and demobilization costs are assumed to be 1% of the direct costs. Contingencies are 2% of the direct costs; the engineering redesign fee, the contractor profit and overhead, and the reclamation fee are set at 1.8%, 15.0%, and 3.9% of direct costs respectively, per agreement with OSM staff.

50.4.4 Total Performance Bond Cost

The total performance bond cost is the sum of the direct and indirect costs and is shown in Worksheet 50.16, Appendix 50.A.

WORKSHEET 50.1

DESCRIPTION OF WORST CASE BONDING SCENARIO

Determination of Maximum Reclamation Requirements

The point at which reclamation liabilities were the greatest occurred during the five-year permit term. The worst case scenario for the No Name pit represented in this bond estimate included the maximum length of pit in the permit area with the Boxcut and topsoil removal. Unit cost will utilize the Navajo Mine 2024 updated cost for demolition, equipment, seeding and mulching and labor.

Dozers will be utilized to push the maximum amount of material into the pits. Any material the dozers cannot move in a cost effective manner will be moved by scrapers or truck/loader fleets. Any areas that do not pass the spoil sampling tests will be mitigated by one of the approved methods in the permit prior to topsoil placement. For the purpose of this reclamation bond calculation, the mitigation rates utilized for regraded areas is 10.8% for No Name. After all spoil is regraded, final pits will be shaped to their final contours, and mitigation material will be placed where required; topsoil will be placed, revegetation will occur with an assumed 20% failure rate and the mine facilities will be removed. Facility areas will be mitigated as required and topsoiled, at this time no facilities are planned in the No Name. The mine will be ready to begin phased bond release with the ultimate goal of total bond release.

Swell factor = 1.142 Weighted Average Between In-Situ and Stockpile Swells

Project: No Name Permit
Date: Apr-2026

WORKSHEET NO. 50.5A
PRODUCTIVITY AND HOURS REQUIRED FOR DOZER USE

Earthmoving Activity:

2 Grading - Dozer

Characterization of Dozer Used (type, size, etc.)[3]

Caterpillar D11R, Universal blade

Description of Dozer Use (origin, destination, grade, haul distance, material, etc.)

-5.0% grade on average
284 ft typical dozer push distance
2,700 Loose clay and sand density [lb/yd^3]

Productivity Calculations[3]:

Operating Adjustment Factor = 0.9 (operator factor) * 1.0 (material factor) * 0.8 (work hour factor) * 1.1 (grade factor) * 0.9 (weight correction factor) * 0.9 (visibility factor) * 1.0 (elevation factor) * 1.1 (production factor) = 0.7

Net Hourly Production = 0.7 (operating adjustment factor) * 1,110 LCY/hr (Normal Hourly Production) = 768 LCY/hr

Hours Required[2] = 2,974,765 LCY (volume to be moved[1]) / 768 LCY/hr (net hourly production) = 3,875.8 hrs

Data Sources:

1) Volume to be moved from Worksheet 3
2) Hours required go to Worksheet 13
3) Caterpillar Performance Handbook, Edition 43

Project: No Name Permit
Date: Apr-2026

WORKSHEET NO. 5B
PRODUCTIVITY AND HOURS REQUIRED FOR DOZER USE

Earthmoving Activity:

23 Backfill Ponds

Characterization of Dozer Used (type, size, etc.)[3]

Caterpillar D11R, Universal blade

Description of Dozer Use (origin, destination, grade, haul distance, material, etc.)

0.0% grade on average
200 ft typical dozer push distance
2,700 Loose clay and sand density [lb/yd^3]

Productivity Calculations[3]:

Operating Adjustment Factor = 0.9 (operator factor) * 1.0 (material factor) * 0.8 (work hour factor) * 1.0 (grade factor) * 0.9 (weight correction factor) * 0.9 (visibility factor) * 1.0 (elevation factor) * 1.1 (production factor) = 0.6

Net Hourly Production = 0.6 (operating adjustment factor) * 1,510 LCY/hr (Normal Hourly Production) = 949 LCY/hr

Hours Required[2] = 21,925 LCY (volume to be moved[1]) / 949 LCY/hr (net hourly production) = 23.1 hrs

Data Sources:

1) Volume to be moved from Worksheet 3
2) Hours required go to Worksheet 13
3) Caterpillar Performance Handbook, Edition 43

Project: No Name Permit
Date: Apr-2026

WORKSHEET NO. 5C
PRODUCTIVITY AND HOURS REQUIRED FOR DOZER USE

Earthmoving Activity:

32 Intentionally Left Blank

Characterization of Dozer Used (type, size, etc.)[3]

Caterpillar D11R, Universal blade

Description of Dozer Use (origin, destination, grade, haul distance, material, etc.)

1.0% grade on average
100 ft typical dozer push distance
2,700 Loose clay and sand density [lb/yd^3]

Productivity Calculations[3]:

Operating Adjustment Factor = 0.9 (operator factor) * 1.0 (material factor) * 0.8 (work hour factor) * 1.0 (grade factor) * 0.9 (weight correction factor) * 0.9 (visibility factor) * 1.0 (elevation factor) * 1.1 (production factor) = 0.6

Net Hourly Production = 0.6 (operating adjustment factor) * 2,690 LCY/hr (Normal Hourly Production) = 1,657 LCY/hr

Hours Required[2] = 0 LCY (volume to be moved[1]) / 1,657 LCY/hr (net hourly production) = 0 hrs

Data Sources:

1) Volume to be moved from Worksheet 3

WORKSHEET NO. 50.15A
PRODUCTIVITY AND HOURS FOR DRILL USE

Earthmoving Activity:

1 Drill & Blast

Characterization of Drill Used

Drill Model	IR DMM2 Drill				
Drill Bit Diameter	10.63 [in]	Burden	26 [ft]	1,233	Volume Shot per hole [bcy]
Drill Rod Length	35 [ft]	Bench Height	40 [ft]		
Penetration Rate	228 [ft/hr]	Spacing	32 [ft]		

Description of Activity:

Drilling holes to provide space for explosives

Calculation:

Cycles per Hour = 60 min (time available) / (10.5 min (drill time) + 1.6 min (rod feed time) + 0.4 min (rod pull time) + 2.0 min (misc.)) = 4.1 cycles/hr

Operating Delays = 30.0 min (lunch) + 15.0 min (shift change) + 10.0 min (blasting) + 6.0 min (service time) + 5.0 min (moving) + 5 min (misc.) = 71 min
= 14.8% of a shift
= 85.2% operational utilization

Effective Pit Utilization (EPU) = 85.2% (operational utilization) * 90.0% (availability) = 76.7%

Maximum Penetration Rate = 40 ft (bench height) * 4.1 cycles/hr (cycles per hour) * 76.7% EPU (pit utilization) = 126.5 ft/hr

Maximum Production:

per Scheduled Shift = 26 ft (burden) * 32 ft (spacing) * 126.5 ft/hr (max. penetration rate) * 8.0 hr/shift (hours in a shift) / 27 ft^3/yd^3 (conversion factor) = 31,184 bcy/shift

per Scheduled Hour = 31,184 bcy/shift (max. production per sched. shift) / 8 hr/shift (conversion factor) = 3,898 bcy/hr

Drill Hours Required = - bcy (volume to be blasted) / 3,898 bcy/hr (production rate) = - hr

Project: No Name Permit
Date: Apr-2026

WORKSHEET NO. 50.15B
